CANDIDATE'S DECLARATION

We declare that 5th semester report entitles "Custom Build E-commerce" is own work conducted under the supervision of the guide **Mr. Vishvendu M. Bhatt.**

We further declare that to the best of our knowledge the report for Diploma final year does not contain part of the work which has been submitted for the award of Diploma Engineering Degree either in this or any Other university without proper citation.

ACKNOWLEDGMENT

Presentation ,inspiration and motivation have always played a key role in the success of any venture.

We pay our deep sense of gratitude to **Mr. Vishvendu M. Bhatt (HOD)** of Computer Engineering Department, Jayvantrai Harrai Desai College, Palsana, Surat to encourage us to the highest peak and to provide us the opportunity to prepare the project. I am immensely obliged to my friends for their elevating inspiration, encouraging guidance and kind supervision in the completion of the project.

We feel to acknowledge with deep sense of gratitude to our external guide **Mr. Mihir Parmar** whose valuable guidance and kind supervision given to us throughout the course had shaped the present work as its show.

Last, but not the least, our parents are also an important inspiration for us. So with due regards, we express our gratitude to them.

ABSTRACT

Definition:-

As we know nowadays, online shopping is becoming more popular among people. People can save time in their busy life but the biggest disadvantage of online Shopping is people can't try products before they buy clothes which make people unsatisfied. Here in this application, using **Augmented Reality** it becomes easier and satisfying.

This application scans customers face, body and apply clothes moreover they can check whether color suits them or not. E-commerce systems adopted AR (augmented reality) and cognitive computing as a new type of the "smart"e-commerce which allow better user interaction, customer satisfaction, shopping value, quality & purchasing decisions. we present a framework for smart e-commerce app development using **Augmented Reality**, mobile technology & cognitive computing functions.

Modules:-

Three paramount of system with sub modules are below-

➤ **Administrator**

Login :- To have full control of the system it is mandatory for admin to login.

Supervising :- Decide which product to display in particular index.

Watch particulars :- Admin can watch all registered user particulars

Watch Feedback :- Admin can watch feedback given by user

➤ **User**

Register: - If user is new to the application, he/she have to register them -selves

Login: - Both new as well as old user have to login with their right credentials only if approved by the administrator.

Search Product: - Users can search products as per their need in search the bar

Filter & sort: - User can filter out or sort their product as per the requirement

Compare: - Users can compare any two products.

Cart: - If a user wants he/she can add a particular product in cart.

Buy: - Users can pay for products either by online/offline mode

➤ **Product owner**

Register:- If product owner is new to the application, he/she has to register themselves.

Login:- To add a product he/she has to login.

Privilege:- Product owner has only the right to add a product but he can't remove it without permission of administrator.

CHAPTER -1

INTRODUCTION

PURPOSE:-

- The primary purpose of this app is to give best shopping experience to the customers.
- To provide valuable product to owners /buyers, desire to retain or obtain a product.
- To adopt 'smart' e-commerce which allow better user interaction, quality and purchasing decision.
- Nowadays in online shopping customers found the clothes which are suit on the models as a solution but sometimes it is possible that it not suit on the customer of this problem our application provides an AR look of the clothes to the customers on their body.

SCOPE:-

- The main scope of this application is to provide secure and easy shopping for user with different types of brands in one app.
- User can easily use this application by various options of brands or other things given in customized shopping application.
- To reduce possibility of product replacement, especially cloth. Customers can easily choose their clothes or other products without any kind of confusion.

OBJECTIVE:-

The objective of this product is to develop an elegant e-commerce system that will be user friendly which supports Augmented Reality concept.

EXISTING SYSTEM:-

- Current application provides pictures of clothes.
- Current application does not provide look of any buyers in particular clothes and customers buy clothes by imaging themselves in that clothes after buying if the customer is unsatisfied.
- He/she is not able to do anything with that clothes. And in that case person lose interest in online shopping of clothes and prefer offline shopping.

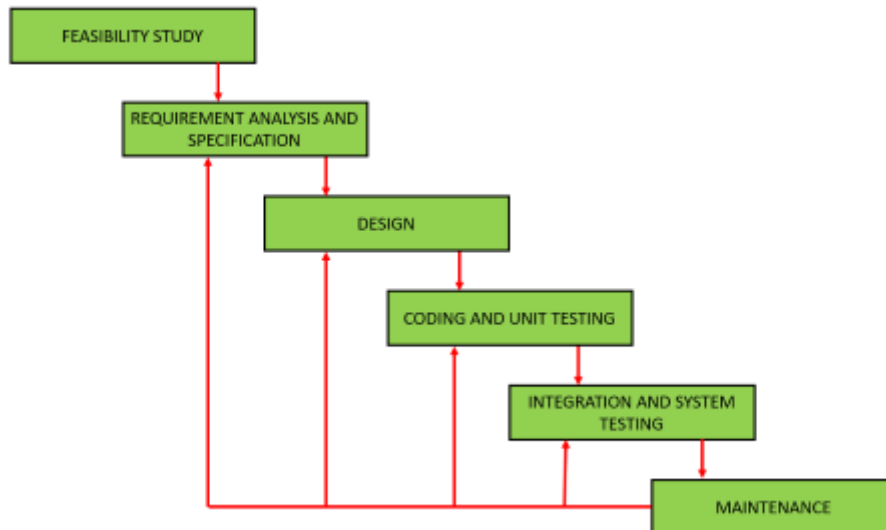

DIFFERENT WITH OTHER SYSTEM:-

- Our application not only provides pictures of clothes but it also provides AR look of that cloth.
- AR look is possible with the help of 'AR core' is a software development kit developed by google that allow augmented reality applications to be built.
- This project presents a framework for smart e-commerce app development using augmented reality mobile technology & cognitive computing functions.
- User can easily customize in the way they want that product.

CHAPTER -2
PROJECT MANAGEMENT

➤ PROJECT DEVELOPMENT APPROACH:-

Iterative Waterfall Model

- **Why do we use this model?**

The iterative waterfall model provides feedback paths from every phase to its preceding phases.

When errors are detected at some later phase, these feedback paths allow correcting errors committed by programmers during some phase.

- **Feasibility study phase**

This phase involves understanding the problem and then determining the various possible strategies to solve the problem.

- **Requirement analysis and specification phase**

The aim of this phase is to understand the exact requirements of the customer and document them properly.

- **Design phase**

The aim of the design phase is to transform the requirements specified in the SRS document into a structure that is suitable for implementation in some programming language.

- **Coding and unit testing phase**

In coding phase software design is translated into source code using any suitable programming language.

The aim of the unit testing phase is to check whether each module is working properly or not.

- **Integration and system testing phase**

Integration of various modules is carried out incrementally over a number of steps.

After all the modules have been successfully integrated and tested, the full working system is obtained and system testing is carried out.

- **Maintenance phase**

Meet the changing customer needs.

Adapt to accommodate changes in the external environment.

Enhancing the efficiency of the software.

➤ **FEASIBILITY STUDY**

A feasibility study is an analysis that takes all of a project's relevant factors into account including economic, technical, legal, and scheduling considerations—to ascertain the likelihood of completing the project successfully.

We use feasibility studies to discern the pros and cons of undertaking a project before they invest a lot of time and money into it.

Following are the way from which we can check software feasibility

- (1) Economically
- (2) Technically
- (3) Operationally

Economically

It determines whether the required software is capable of creating financial gains for an organization it involves the cost incurred on the software development team, estimated cost of hardware and software, cost of performing feasibility study, and so on.

Our project follows the criteria of economic feasibility as there is one time investment for the resources required to develop this project and resources are free of cost.

Technically

This assessment focuses on the technical resources available to the organization. It helps organizations determine whether the technical resources meet capacity and whether the technical team is capable of converting the ideas into working systems.

Resources (software, hardware) required to develop this project are available so, our project follows the criteria of technical feasibility.

Operationally

This study describes if software performs all the operations in the way it should? As well as analyses whether a user adopts software easily or not.

This project performs all the operations in the way it should.

This project allows the users to adopt software easily. And hence this project is operationally feasible.

CHAPTER -3
SYSTEM ANALYSIS

STUDY OF CURRENT SYSTEM

Application provides different brands, materials, size, colour and other details with the price of the clothes with attractive pictures.

It also provide a feature by which customers can return the clothes (in case of problem in size or colour, or if the product is defective) and in exchange customer can ask for refund or exchange with particular cloth.

PROBLEM AND WEAKNESS OF CURRENT SYSTEM

Current application provides pictures of clothes, and he /she have to imagine his/her self in that cloth.

It is possible that after buying that cloth he/she may not like that cloth, in this case customers were unsatisfied.

Current application does not provide look of the buyer in particular cloth.

User don't receive a valuable product.

REQUIREMENT OF NEW SYSTEM

➤ Functional Requirements:-

- Admin:

- Login : User can login using his/her user id and password.
- Manage app : Will store all the information and verify all user and Collect their order.

- Customer:

- Login : User can login using his/her user id and password.
- Registration : Filling own information for registration and for login.
- Select item : User can select items of their choice.
- Add item : User can add many items as their needs.
- Place order : User place an order.
- Chat box : In case of any query user can chat with admin.

- Payment:

Payment can be done either online or by cash on delivery.

➤ **Non Functional Requirements:-**

- **Security:**

Security is required so that no personal information of user is leaked and the data of system is secured.

Our system secures web attacks like SQL injection, spam bot etc.

- **Atomicity:**

Unauthorized people can't operate this application.

- **Reliability:**

Reliability stands for trust. user's personal information will not be disclosed here.

- **Flexibility:**

System is very flexible to use, as it is user friendly, it requires less maintenance.

- **Efficiency:**

User can easily search products of their choices.

- **Reusability:**

Under the software license agreement system will be reuse in other system.

- **Integrity:**

Only the system admin has the right to access the database, user will only have access to their account.

CLIENT SIDE REQUIREMENT

- Hardware interfaces

Mobile : Android phone with 5.0
version(lollipop).
Ram : 4GB
Disk space : 250GB minimum

- Software interface

Client on internet : Web browser
Client on mobile : Android phone with 5.0
version(lollipop)

SERVER SIDE REQUIREMENT

- Hardware interface

Ram : 1GB
Disk space : 20GB minimum
Database : MySQL
Firebase : Push notification

- Software interface

Software : Abode Dreamweaver CS5
Server on internet : Web browser
Server : PHP development wamp
server

DEVELOPMENT END

- PHP 7.0
- MySQL 5.7
- Sublime text editor
- Android Studio
- SDK (Software Development Kit)
- Wamp Server 3.0.6 3.0.
- Internet Explorer 8.0, Mozilla Firefox, Google Chrome
- AR (Augmentation reality) core

CHAPTER -6
LIMITATION AND FUTURE
ENHANCEMENT

➤ **LIMITATION**

As we are using Augmented Reality (AR) we think that not running AR effectively in every android smart phone is the limitation for us.

➤ **FUTURE ENHANCEMENT**

While during our semester 5 we have learned about the design of the application and more it like about the HTML, CSS , BOOTSTRAP AND JS Moreover we have completed our reporting work in semester 5. We are the students from semester 6 who is going to create an android application and admin panel.

CHAPTER -7
CONCLUSION

➤ CONCLUSION

This report presents a augmented reality application where the user can select the garments with respect to the user needs like color, size, fitting, etc. it takes a lot of time for selecting the Proper garments which suit on their body.

So, we can conclude that the G-KART application helps the users to select and choose the dress in lesser time.
